

EDGECIPLINE

B2B Expansion: Institution & Academy Program

Bringing Edgecipline into trading academies, prop firms and coaching institutes — with a dedicated Institution Admin portal

Prepared from the Stratedge codebase

Last updated: 2026-07-22

Version: 1.0 — Strategic Plan & Product Spec

B2B2C SaaS

Multi-Tenant Admin

Trading Academies

Prop Firms

Seat-Based Pricing

"Edgecipline already proves discipline, not just P&L. That is exactly what an academy needs to prove to its students — and what a prop firm needs to see before handing out capital."

1. Opinion — Should We Do This?

Yes — this is one of the better expansion moves available to Edgecipline right now, and it fits the product you already have rather than requiring a new one. The core B2C product (screenshot-in, journal-out, discipline coaching) is a single-player tool. The moment a trading academy, mentorship program or prop firm is added on top, the same data becomes a supervision tool — and supervision is something institutions will pay a recurring seat fee for, on top of (not instead of) what individual traders already pay.

Three things make this a "second stage," not a rebuild:

- The admin layer is **already architecturally separate** — `backend/admin/` has its own routes, controllers and JWT middleware, isolated from the regular user auth flow. Adding a third tenant-scoped admin role is an extension of a pattern that already exists, not a new one.
- The metrics an institution actually wants to see — checklist adherence, discipline/psychology scores, mission completion, streaks, weekly reports — **already exist per user**. Nothing new needs to be measured; it needs to be aggregated and exposed to a second party.
- Monetization is additive. Institution licensing is a new revenue line sold to a different buyer (the academy owner, not the trader), so it does not cannibalize the existing Razorpay subscription revenue — it can subsidize it.

The honest caveat: this is a B2B sales motion layered on a product built for self-serve B2C growth. It needs a real (even if small) sales/onboarding effort — academies do not sign up the way individual traders do. Budget for that explicitly; do not assume it will grow itself.

Bottom line

Build a lightweight Institution Admin tier first (Phase 1, 4–6 weeks), sell it to 5–10 design-partner academies for free or heavily discounted in exchange for feedback and case studies, then turn on paid seat billing once the workflow is proven. Do not build the full white-label / LMS-integration vision up front — that is a Phase 3 problem.

2. Why Edgecipline Is Well-Positioned for B2B

Most trading-journal competitors (TradeZella, Tradervue, generic spreadsheet templates) sell analytics on P&L. Edgecipline's actual differentiator — discipline scoring, psychology tagging, checklist adherence, missions, streaks — is a much better fit for an institutional buyer than for an individual trader, for one simple reason: **an academy's core problem is proving that its teaching changed student behavior, not just whether a student made money.** A student can lose money while following the plan perfectly (good process, bad variance) or make money while breaking every rule (good luck, bad process). Academies need to see the process. Edgecipline already logs the process.

Data Edgecipline already captures per user	Why an institution cares
Checklist adherence per trade (setupScore, followedRules)	Did the student trade the strategy they were taught?
Psychology tags — mood, confidence, entryBasis (Plan/Emotion/Impulsive), FOMO/revenge flags	Behavioral red flags an instructor can intervene on early
Discipline missions (risk-per-trade, stop-loss-required, no-revenge-trade, daily reflection)	Structured, gamified reinforcement of exactly what a course teaches
Streaks & consistency tracking	Attendance/engagement proxy for a cohort
Weekly AI-generated reports	Ready-made progress reports an instructor can forward to a student's parent/sponsor or use in a batch review call
OCR-based screenshot capture (near-zero logging friction)	Students in a course will actually keep it up — friction is the #1 reason journaling mandates fail in academies today

In short: the product was built to answer "is this trader becoming more disciplined?" — which is precisely the question every trading educator, mentor and prop-firm evaluator is trying to answer about the people under them. B2B here is not a pivot; it is selling the same insight to the person who is paying for the outcome, not just the person experiencing it.

3. Target Segments

Segment 1 — Trading Education Academies & Influencer Courses (primary, start here)

India has a large and growing market of paid trading courses — YouTube educators, Telegram/Discord mentorship groups, structured academies (NSE/BSE-adjacent options and F&O training). These already charge students ₹5,000–₹50,000+ for a course and are actively looking for a way to prove outcomes and differentiate from low-quality competitors. Edgecipline becomes their "student progress dashboard."

Lowest sales friction, fastest to close, most aligned product fit — prioritize this segment for the Phase 1 pilot.

Segment 2 — Prop Trading Firms & Funded-Account Programs

Prop firms and funding-challenge providers need to evaluate trader discipline before allocating capital, and monitor it afterward to protect the firm's capital. Edgecipline's discipline score and rule-violation flags map directly onto their risk criteria (max daily loss, stop-loss discipline, revenge-trading detection). Slower sales cycle than academies but much higher willingness to pay per seat, and a strong "we caught this risk before it blew an account" story.

Segment 3 — Corporate / Institutional Trading Desks & Internal Mentorship Programs

Smaller near-term opportunity but a credible longer-term one: brokerages or fintechs running internal trainee desks, or wealth-management firms with junior trader onboarding programs. Longest sales cycle, needs compliance sign-off — treat as Phase 3+, not a launch target.

Recommended sequencing

Segment 1 → Segment 2 → Segment 3. Academies validate the product and pricing fastest; prop firms validate willingness-to-pay at a higher price point once the discipline-scoring product is proven; corporate desks come once there is a case-study library to point to.

4. The Offer — What an Institution Buys

An academy owner (or prop-firm risk manager) buys a license that gives them a bounded, cohort-scoped window into their own students — not a general admin panel, and never visibility into other institutions' students or platform-wide data.

For the institution

- Invite students under their own institution code
- Roster view: who has joined, who is active, who has gone quiet
- Cohort-level discipline & adherence analytics
- Per-student drill-down (with consent — see Section 6)
- Assign checklists/missions to the whole batch at once
- Exportable weekly progress reports per student/cohort

For the student

- Same Edgecipline app they already know
- Clear, explicit consent screen on what their instructor can see
- Discounted subscription (subsidized by the institution license)
- Cohort leaderboard — opt-in, discipline-based not P&L-based (avoids toxic "who made more money" comparison)

Note the deliberate asymmetry: the institution gets aggregated behavioral insight, the student keeps full ownership of their raw trade data and can revoke visibility. This is both an ethical necessity and a selling point academies can use with their own students ("we track your discipline, not your losses").

5. Institution Admin Portal — Product Spec

A third, tenant-scoped admin tier — separate from both the regular user app and the existing platform-level admin console. Same architectural pattern as `backend/admin/`, but every query is filtered to `institutionId`.

5.1 Roles

Role	Scope	Example
Platform Admin (existing)	Everything, all institutions, all users	Internal Edgecipline ops team
Institution Owner (new)	Their own institution: roster, billing, cohort settings	Academy founder
Institution Staff (new, optional Phase 2)	Same as Owner minus billing	Course mentor / TA
Student (existing)	Their own data; consents to institution visibility	Enrolled trader

5.2 Core screens

Roster

List of enrolled students with join date, active/inactive status, subscription status, last trade logged. Invite via unique join code or emailed link; bulk CSV import for existing batches. Remove/archive a student without deleting their personal account.

Cohort Analytics

Aggregated, anonymized-by-default view: average discipline/checklist-adherence score, % following stop-loss rule, % completing daily reflections, mission completion rate, distribution of psychology tags (FOMO/revenge/plan-based) across the batch. This view needs **no per-student consent** since it is aggregate-only.

Student Drill-Down (consent-gated)

Per-student discipline score, checklist history, mission progress, weekly report summary. Raw trade P&L, account balance and instrument details are hidden by default and only shown if the student has explicitly opted in to "full visibility" beyond the default "discipline metrics only" consent tier.

Batch Actions

Assign a mission or checklist template to the entire cohort at once; push an announcement/notification to the batch; export a cohort progress report (PDF/CSV) for a parent call, sponsor update, or internal review.

5.3 Student-side additions

- "Join with institution code" step during onboarding or from Profile
- One-time, explicit consent modal on join: two tiers — **"Discipline metrics only"** (default) vs **"Full visibility including trades & P&L"** (opt-in)
- Visible badge in-app: "Enrolled under [Academy Name] — [consent tier] visible to your instructor" with a one-tap revoke
- Cohort leaderboard opt-in toggle, ranked by discipline score not profit

5.4 Explicitly out of scope for Phase 1

- White-label branding (custom domain/logo per institution) — Phase 3
- LMS integrations (Google Classroom, custom course platforms) — Phase 3
- Institution-to-institution comparison/benchmarking — not planned; conflicts with the privacy stance
- Automated grading/certification — Phase 3, only if academies explicitly ask for it

6. Data Privacy & Consent Model

Trade and P&L data is financially sensitive personal data. This is the one area where cutting corners will cost trust with both students and academics, so it is treated as a first-class design constraint, not an afterthought.

Principles

1. **Opt-in, not opt-out.** A student's data is never visible to an institution until they explicitly join that institution and accept a consent screen.
2. **Tiered visibility, aggregate by default.** Cohort-level aggregates require no per-student consent. Individual drill-down requires consent. Raw P&L/balance requires a second, separate consent tier.
3. **Revocable at any time.** A student can leave an institution or downgrade their consent tier from their own Profile page, instantly cutting off future visibility (historical reports already generated are not retroactively un-shared — this is disclosed up front).
4. **Institution isolation.** An institution admin can never query or see data belonging to another institution's students, or platform-wide data. Enforced at the query layer ('institutionId' filter on every admin repository call), not just in the UI.
5. **Minors & account ownership.** Institution accounts must confirm the student is the account owner and of legal age, or route through a parent/guardian consent flow if the academy serves minors — flag this explicitly in institution onboarding terms.

This consent model is also a marketing asset, not just a compliance box: "your instructor sees your discipline, not your losses" is a genuinely differentiated, trust-building pitch students will respond to — most existing academy tracking (screenshots in a WhatsApp group, manual spreadsheets) has zero privacy model at all.

7. Technical Architecture & Build Plan

This extends the existing codebase rather than forking it. It reuses the pattern already established by ``backend/admin/`` (separate routes, separate JWT middleware) and the existing per-trade discipline/checklist/mission data that already exists on `Trade`, `IndianTrade`, `ChecklistTracking`, `MissionAssignment` and `WeeklyReport`.

New data model

Model	Key fields
Institution (new)	name, joinCode, plan, seatLimit, billingContact, contactEmail, brandingConfig (Phase 3), createdAt
InstitutionMembership (new)	userId, institutionId, role (owner/staff/student), consentTier (discipline_only/full), status (active/archived), joinedAt
User (extend existing)	add optional institutionId reference; role enum extended with institution_owner / institution_staff

New backend surface

- `backend/institution/routes/` and `controllers/` — mirrors the existing ``backend/admin/`` structure, own JWT middleware scoped by `institutionId`
- `POST /api/institution/join` — student redeems join code + consent tier
- `GET /api/institution/roster`, `GET /api/institution/analytics/cohort`, `GET /api/institution/students/:id` (consent-gated), `POST /api/institution/missions/assign-batch`
- `backend/services/institutionAnalyticsService.js` — aggregates existing per-user discipline/checklist/mission data by `institutionId`; no new metrics need to be computed, only new aggregation queries
- Repository-layer enforcement: every institution query is filtered by `institutionId` at the repository, not just the controller, so a bug in one endpoint cannot leak cross-tenant data

New frontend surface

- `frontend/app/institution-admin/` — separate route tree, separate auth guard from the regular app and from the platform admin
- Reuses existing analytics/chart components (Recharts) already built for the personal dashboard — cohort view is largely the same components fed aggregated data
- Consent modal + institution badge added to the existing onboarding flow and Profile page

Why this is a moderate, not a large, engineering lift

The three hardest parts of a "multi-tenant admin" feature — role-based auth separation, aggregating behavioral metrics, and a query/analytics UI layer — already exist in the codebase in a form that can be extended:

Needed capability	Already exists as
Separate admin auth/JWT tier	backend/admin/ + adminAuth.js middleware
Per-user discipline/behavioral scoring	Mission progress, checklist score, psychology tags, weekly reports
Analytics aggregation & charting	analyticsController endpoints + Recharts components
Bulk notification delivery	notificationService.js / admin/notifications

What is genuinely new: the Institution/InstitutionMembership data model, the consent flow, and the tenant-scoped query filtering. Estimated effort for Phase 1 (Section 10): 4–6 engineering weeks for a single full-stack developer, assuming no white-labeling or billing automation yet.

8. Pricing & Packaging

Tier	Who it's for	Price (illustrative)	What's included
Pilot / Design Partner	First 5–10 academies	Free for 60–90 days	Full Phase 1 feature set, in exchange for feedback + a case study/testimonial
Academy Standard	Trading education academies, up to ~100 seats	₹99–149 / student / month (billed to institution, annual discount available)	Roster, cohort analytics, consent-gated drill-down, batch mission assignment
Prop Firm / Funded Program	Prop firms, funding-challenge providers	₹199–299 / seat / month or per-evaluation fee	Everything in Standard + risk-flagging alerts (stop-loss violations, daily-loss-limit breaches, revenge-trade detection) surfaced in near real time
Enterprise (Phase 3)	Large academies, brokers, corporate desks	Custom / negotiated	White-label branding, LMS/API integration, dedicated support

Individual students under an institution license still pay their own discounted Edgecipline subscription (or it is bundled into the institution's course fee) — the institution license is a separate line covering the admin/analytics layer, not a replacement for the existing Razorpay subscription revenue.

9. Go-To-Market Plan

Channel 1 — Direct outreach to trading educators (primary)

India has a large, identifiable population of trading course creators on YouTube/Telegram/Instagram running paid cohorts. Direct DM/email outreach with a short demo ("here's what your batch's discipline dashboard would look like") converts faster than any paid channel at this stage. Target: 30–50 outbound conversations to land 5–10 pilot academies.

Channel 2 — Existing user referral

Some current Edgecipline users are themselves mentors or run small trading groups informally. Surface an "Are you a trading mentor/educator? Bring your students to Edgecipline" prompt inside the app to the existing user base — near-zero cost, high-intent lead source.

Channel 3 — Prop firm partnerships (Segment 2, after pilot proof)

Once 2–3 academy case studies exist ("this cohort's stop-loss adherence went from 40% to 78% in 6 weeks"), use them to open conversations with prop/funding-challenge firms — a much more skeptical, data-driven buyer that needs proof before a pilot.

Pilot success criteria before charging

- At least 3 of 5–10 pilot academies have >60% of their roster actively logging trades weekly
- At least one measurable cohort-level improvement in a discipline metric over the pilot period
- At least 2 academies willing to go on record with a testimonial/case study

10. Phased Roadmap

Phase 1 — MVP (Weeks 1–6)

Institution & InstitutionMembership models. Join-code flow + consent modal. Institution admin auth (separate tier, same pattern as existing admin). Roster view. Cohort analytics (aggregated, no consent needed). Consent-gated per-student drill-down. Manual/free onboarding for 5–10 design-partner academies.

Phase 2 — Monetize & Strengthen (Weeks 7–14)

Seat-based Razorpay billing at the institution level. Batch mission/checklist assignment. Opt-in discipline leaderboard. Institution Staff role (mentors/TAs, not just owners). Exportable PDF/CSV cohort reports. Begin Segment 2 (prop firm) conversations using pilot case studies.

Phase 3 — Scale (Month 4+)

White-label branding per institution. Risk-flagging/alerting for prop-firm use cases (real-time stop-loss/daily-loss-limit breach notifications to the institution admin). LMS/API integration for larger academies. Evaluate demand for institution-to-institution benchmarking cautiously, respecting the privacy stance in Section 6.

11. Financial Projection (Illustrative)

Rough, conservative modeling to size the opportunity — not a forecast. Assumes Academy Standard pricing at ₹120/student/month average (blended after annual discounts) and a slow, outbound-driven ramp.

Milestone	Academies	Avg seats/academy	Total students	Monthly institution revenue (approx.)
Pilot (Month 1–3)	5–10	25	~125–250	₹0 (free pilot)
Early paid (Month 4–6)	10	30	~300	~₹36,000/mo
Growth (Month 7–12)	35	35	~1,225	~₹1,47,000/mo
Scale (Year 2 target)	100	40	~4,000	~₹4,80,000/mo

This is purely the institution-license line. It is additive to, not a substitute for, the existing direct-to-consumer subscription revenue — and a meaningful share of institution students will also be net-new individual subscribers who would not have found Edgecipline otherwise, since academy enrollment becomes a new acquisition channel for the core product.

12. Risks & Mitigations

Risk	Severity	Mitigation
Students perceive institution visibility as surveillance and disengage	High	Strict opt-in consent tiers (Section 6), discipline-only default, one-tap revoke, clear in-app messaging
B2B sales cycle stalls — academies are slow, informal decision-makers	Medium	Start with free pilots to remove the money conversation entirely; convert to paid only after proven engagement
Cross-tenant data leak (one institution sees another's students)	High	Enforce <code>institutionId</code> filtering at the repository layer, not just controllers; add integration tests specifically for tenant isolation before launch
Academy churns after pilot, no paid conversion	Medium	Gate Phase 1 pilots on the engagement thresholds in Section 9 before investing in Phase 2 billing work
Feature scope creep (white-label, LMS integration) delays MVP	Medium	Explicitly out-of-scope list in Section 5.4; Phase 3 items stay Phase 3 until Phase 1/2 are validated
Regulatory/compliance exposure around student financial data	Low–Medium	No SEBI/RBI registration implication for a journaling tool, but treat trade data with the same care as any sensitive personal financial data; consent model in Section 6 is the primary control

13. Success Metrics

Metric	Phase 1 target
Pilot academies onboarded	5–10
Weekly active students per active cohort	>60%
Cohort discipline-score improvement over pilot period	Measurable upward trend in at least half of pilots
Pilot-to-paid conversion rate (Phase 2)	>40% of pilots
Net-new individual subscribers sourced via institution channel	Tracked as a distinct acquisition channel from day one

14. Recommendation & Next Steps

1. Approve Phase 1 scope as defined in Section 10 — resist adding white-label/LMS/billing automation until the pilot validates demand.
2. Identify 15–20 candidate academies/educators for outbound (Section 9, Channel 1) while Phase 1 is being built, so pilots can start the week engineering finishes.
3. Build the consent model (Section 6) alongside the core feature, not after — retrofitting privacy controls onto live student data is much harder than shipping them from day one.
4. Set the Section 9 engagement thresholds as an explicit go/no-go gate before starting Phase 2 billing work.
