

Edgecipline: 3-Month and 6-Month Roadmap

Feature plan to retain users. Based on the current product (coach, Trading DNA, streaks, missions, reflections, weekly reports, notifications, Play Billing) and the open launch items. Priorities are judgement, not user data.

Months 0-3: Stabilise, then build the habit loop

Goal: keep the users who install. First-week and first-month drop-off is where most loss happens.

Fix and finish (weeks 1-3)

#	Item	What and why
1	Confirm Play 1.1.2 and server	Check production review cleared. Make sure EC2 pulled the latest code and restarted the API.
2	RTDN for Play Billing	Real-time notifications so renewals, cancellations and refunds sync automatically.
3	Sentry upload token	Makes release crash reports readable.
4	Plan labels and billing UI	3-month and 6-month subscribers currently see 'Monthly Pro'. Add a Manage-subscription link and clearer post-charge error text.
5	Android coupons	Add via Play developer-determined offers, mapped from coupon to offerId in the backend.
6	Funnel tracking	Install, first upload, first week, paid. Needed to know which feature below works.

Retention features (weeks 3-12)

#	Item	What and why
7	Faster first value	Show a real insight right after the first trade (e.g. 'your 3 losses came after 2pm'). Do not make users wait for 20 trades.
8	Daily 'close your day' flow	One screen after market hours: review trades, rate discipline, one-line reflection. Reuses reflection and discipline code.
9	Streak freeze and comeback	Freeze days and a friendly return message after a missed week, not a guilt notification.
10	Weekly report as an event	Shareable, pushed every Sunday with one headline: best habit, costliest mistake.
11	Bulk and quick upload	Multi-screenshot upload and share-to-app straight from the broker app.
12	Smarter notifications	Timing based on when each user actually trades, plus a daily cap.
13	Android home-screen widget	Today's P&L; and streak at a glance.
14	What's new and review prompt	In-app release notes, and ask for a Play review after a good moment such as a win streak.

Months 3-6: Depth, trust and growth

Goal: make leaving costly and the product worth paying for.

#	Item	What and why
15	Broker import (CSV / contract note)	Zerodha, Upstox, Angel One exports. More reliable than screenshots and removes upload friction. Direct broker API sync later.
16	Goals and risk rules	Daily loss limit and max trades, with a warning at the moment of breaking it. Likely the strongest retention feature for a discipline app.
17	Coach that remembers	Uses past reflections and Trading DNA for personal advice. Keep per-plan daily message limits.
18	Monthly review and progress	Compare to last month. Badges for habits improved, not for profit.
19	Pre-trade checklist enforcement	Link checklist to a trade plan. Show win rate when followed vs not followed.
20	Calendar and journal view	P&L; calendar with notes per day. Search and tags across trades.
21	Export (PDF / CSV)	Data portability builds trust and helps paid conversion.
22	Referrals	Free month for both sides. Coupon and promotion infrastructure already exists.
23	Language support	Hindi first, then others. The audience is India-first.
24	iOS release	Project exists but was never built or shipped. Needs a Mac, Apple developer account and App Store review.
25	Plan and pricing test	Yearly plan, student discount, and a better free tier. Current limit is one free screenshot, which may be too tight to show value.

Longer term

Prop-firm and challenge tracking for Forex traders. Community with an accountability partner. Direct broker API sync.

If you pick only three

Items 4 and 2 (they protect revenue), then 16 (risk rules) and 8 (daily close flow). Together they give users a daily reason to open the app.
