

Psychology Analytics Workflow

Complete start-to-end flow: how psychology data is logged, stored, calculated, and shown in analytics.

1. Purpose

The psychology system turns each trade into more than entry, exit, and P&L. It records the trader's mental state, confidence, emotional triggers, and review judgment. Analytics then compares those states against actual performance.

2. Data Captured Per Trade

Entry Basis

Stored as `entryBasis`.

- `Plan` - trade followed a planned setup.
- `Emotion` - trade came from emotion.
- `Impulsive` - trade was rushed or unplanned.
- `Custom` - user writes a custom reason.

Mood

Stored as `mood`, a number from 1 to 5.

- 1 = Stressed
- 2 = Anxious
- 3 = Neutral
- 4 = Good / Focused
- 5 = Peak

Confidence

Stored as `confidence`.

- `Low`
- `Medium`
- `High`
- `Overconfident`

Emotional Tags and Retake

Stored as `emotionalTags` and `wouldRetake`.

- Tags: FOMO, Revenge, Fear, Greed, Calm, Focused, etc.
- Would Retake: `Yes` or `No`.

3. Storage Location

Indian market psychology fields are stored in:

```
backend/models/IndianTrade.js
```

Important model fields:

```
entryBasis
entryBasisCustom
mood
confidence
emotionalTags
wouldRetake
```

4. User Input Flow

Manual/edit trade page: `frontend/app/indian-market/trades/edit/page.js`

The Psychology section shows mood buttons, confidence buttons, emotional tag chips, and the Would Retake toggle.

Upload flow: `frontend/features/trade/hooks/useUploadTrade.js`

Uploaded trades keep the same psychology fields when building the save payload.

5. Save Payload

When a trade is saved, the frontend sends a trade payload similar to:

```
{
  entryBasis: "Plan",
  mood: 3,
  confidence: "Low",
  emotionalTags: ["Calm", "Focused"],
  wouldRetake: "Yes"
}
```

The backend saves these values in the same Indian trade document as symbol, entry, exit, quantity, and P&L.

6. Analytics API Flow

Frontend call: `getPsychologyAnalytics(MARKETS.INDIAN_MARKET, instrumentType)`

Frontend file: `frontend/services/analyticsApi.js`

Backend route: `/analytics/psychology`

Backend controller: `backend/controllers/indianAnalyticsController.js`

Main function: `getPsychologyAnalytics`

7. Backend Calculations

Mood vs Performance

Trades are grouped by mood level. For each mood bucket, backend calculates:

- trade count
- wins
- losses
- win rate
- average P&L
- total P&L

Confidence Calibration

Trades are grouped by `Low`, `Medium`, `High`, and `Overconfident`.

This shows whether the user's confidence is aligned with actual trade results.

Emotional Tag Impact

Trades are grouped by each emotional tag. This reveals which emotional states are profitable or harmful.

Would Retake Analysis

Trades are split into two review buckets:

- `wouldRetake === "Yes"`
- `wouldRetake === "No"`

Each bucket gets trade count, win rate, average P&L, and total P&L.

8. Psychology Score Formula

Final score is 0 to 100.

```
psychologyScore =  
  planAdherencePct * 0.30  
+ calmTradingPct * 0.25  
+ noRevengePct * 0.20  
+ goodMoodPct * 0.15  
+ wouldRetakePct * 0.10
```

- **Plan adherence:** how many trades followed the plan.
- **Calm trading:** how many trades were tagged Calm or Focused.
- **No revenge:** avoids larger-risk trades after a same-day loss.
- **Good mood:** mood 3 or above.
- **Would retake:** trades the user believes were worth repeating.

9. Analytics Display

The Indian analytics UI renders this data in:

```
frontend/app/indian-market/analytics/page.js
```

The page shows:

- Psychology Score
- Plan Adherence
- Calm Trading
- Mood vs Performance
- Confidence Calibration
- Emotional Tag Impact

- Would Retake
- Would NOT Retake

10. Psychology Insights

The frontend function `generatePsychInsights()` converts analytics numbers into practical coaching text. Examples:

- **Trade best when Neutral:** generated from the best mood bucket.
- **Low confidence trades are profitable:** generated if low-confidence trades have positive average P&L.
- **Calm state is your edge:** generated if Calm/Focused tags perform strongly.
- **Greed trades cost you money:** generated if a risk tag has negative average P&L.

11. Complete Flow Summary

12. Useful Improvement Note

The analytics copy currently says "option journal" in one place. For better wording across options and stocks, it should say "Indian market journal".
